Good persons & bad brains?

Fallon: “PET scan of a killer”

New ways of knowing immorality in the brain

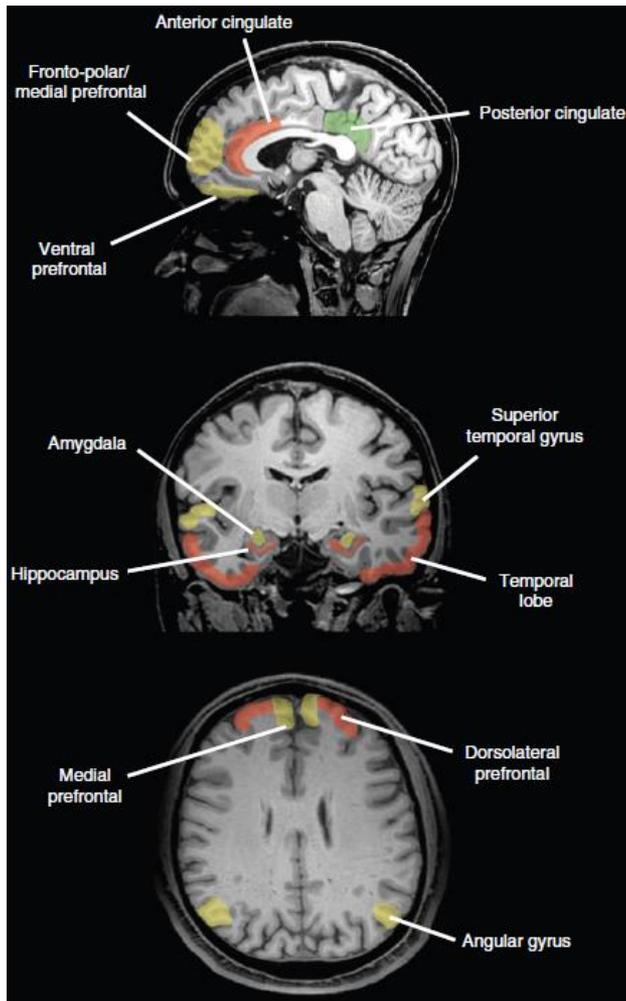

Fig. 1 A schematic diagram of brain regions impaired only in antisocial groups (red), activated only in moral decision-making (green) and regions common to both antisocial behavior and moral decision-making (yellow).

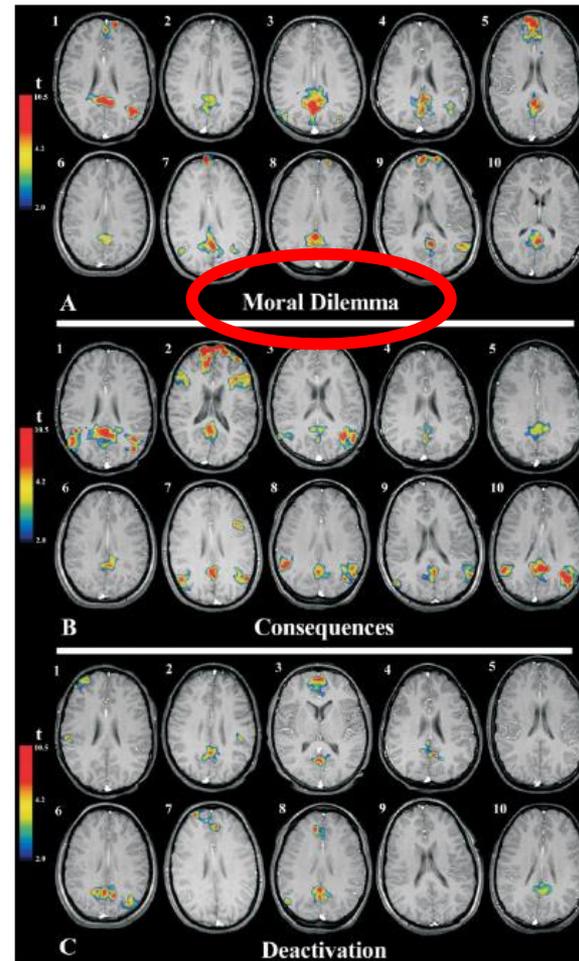

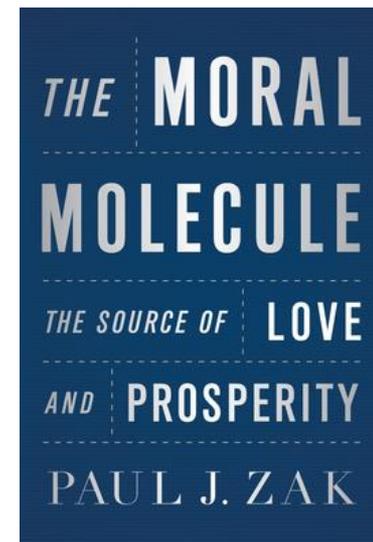

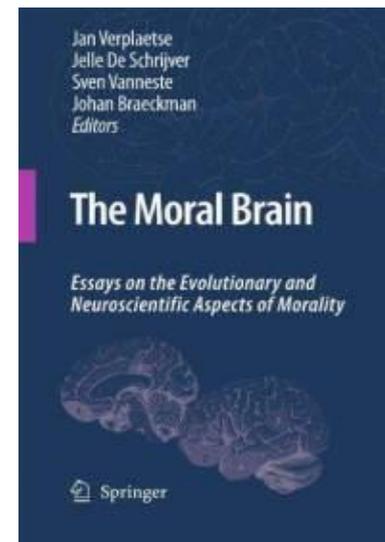

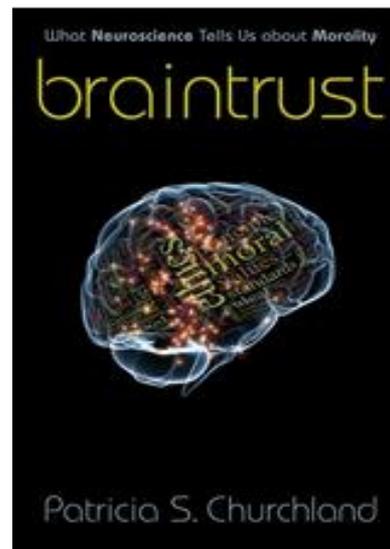

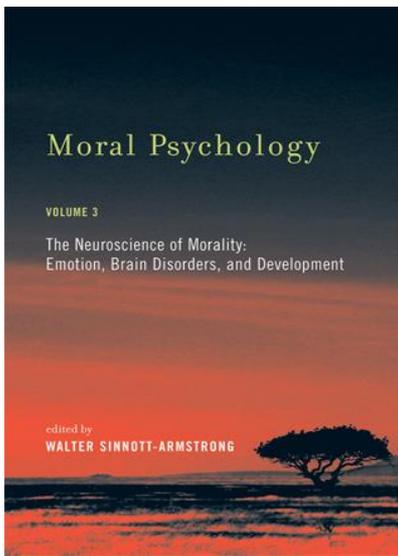

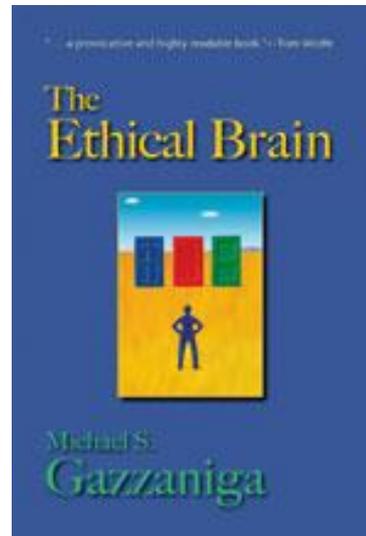

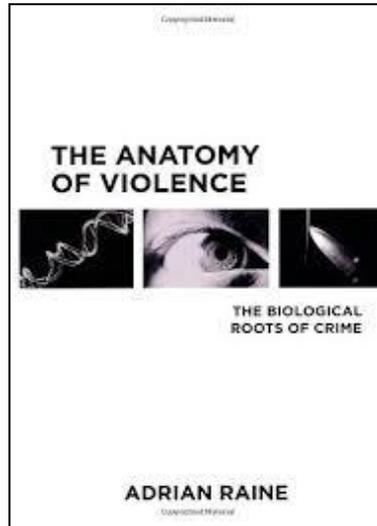

Figure 3. Individual subject activations of the posterior cingulate cortex. (A) (top): transverse images showing the magnitude and extent of peak activations in all 10 subjects during the moral dilemma condition. (B) (middle): transverse images showing the magnitude and extent of peak activations in all 10 subjects during the consequence of judgment condition. (C) (bottom): transverse images showing the magnitude and extent of peak deactivations in six of the ten subjects with the contrast "simple answer" minus "simple answer condition." In all images, functional activations correspond to t values greater than 4.2, $P < 0.0001$ (uncorrected). Images are displayed in radiological format. Subjects 2, 6, 7, and 8 – female subjects. [Color figure can be viewed in the online issue, which is available at www.interscience.wiley.com.]

A current surge...

Personhood & Brain

- Homo cerebralis (Hagner, 2008)
- Brainhood (Vidal, 2010)
- Cerebral subject (Ehrenberg, 2004)
- Neurochemical selves (Rose, 2003)

Being an immoral person

=

having a disordered brain?

What Makes Us Good/Evil

Humans are the planet's most noble creatures—and its most savage. Science is discovering why

BY JEFFREY KLUGER

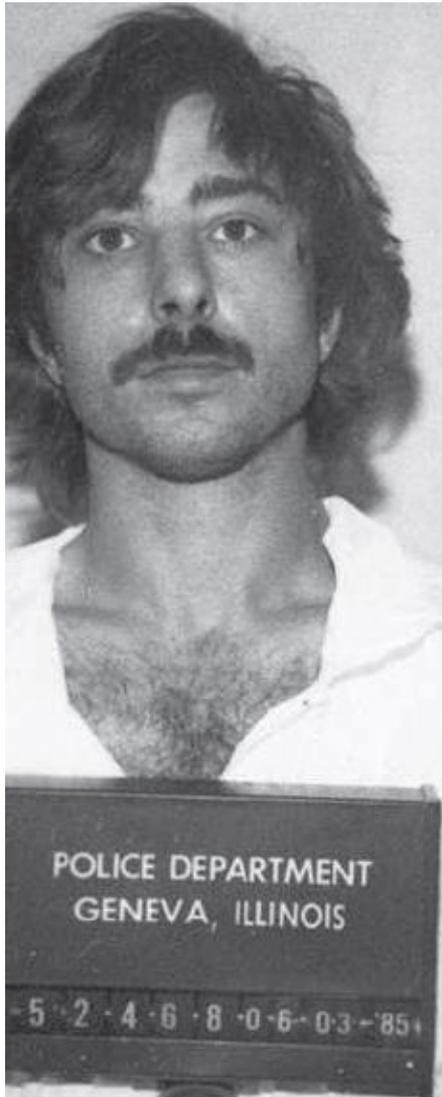

HEAD CASE

Last year, functional magnetic resonance imaging made its debut in court.

“Without the brain imaging stuff the jury would have been back in an hour,”

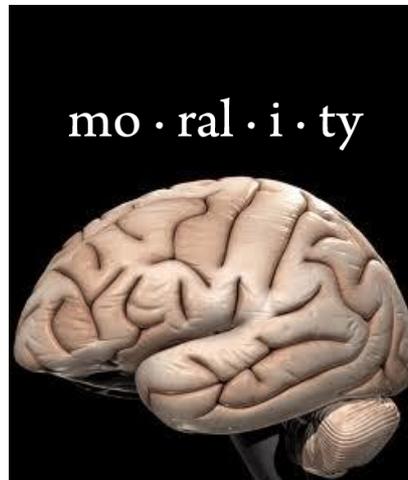

Dugan’s defense attorney, Steve Greenberg

Neuroscientific knowledge → social action

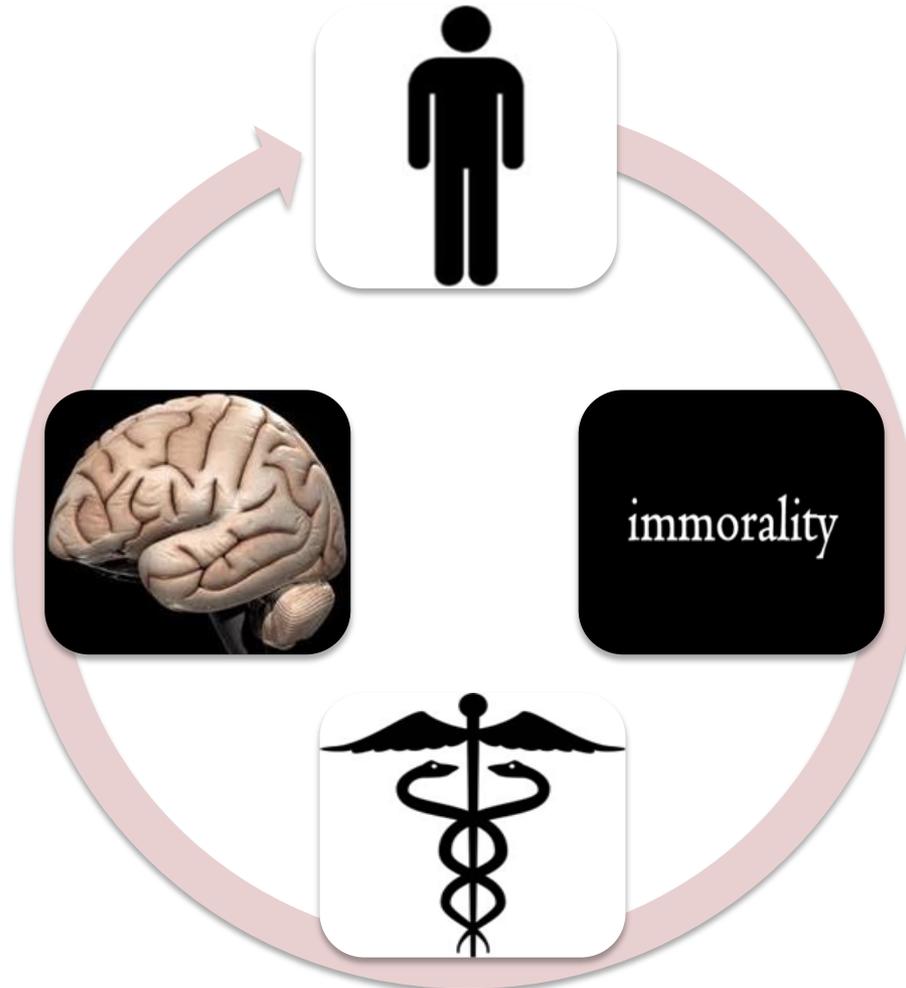

Performativity/co-construction of science and society

- **Consequences for understanding, evaluating, judging immoral persons**
- **modes of interpretation determine courses of action**

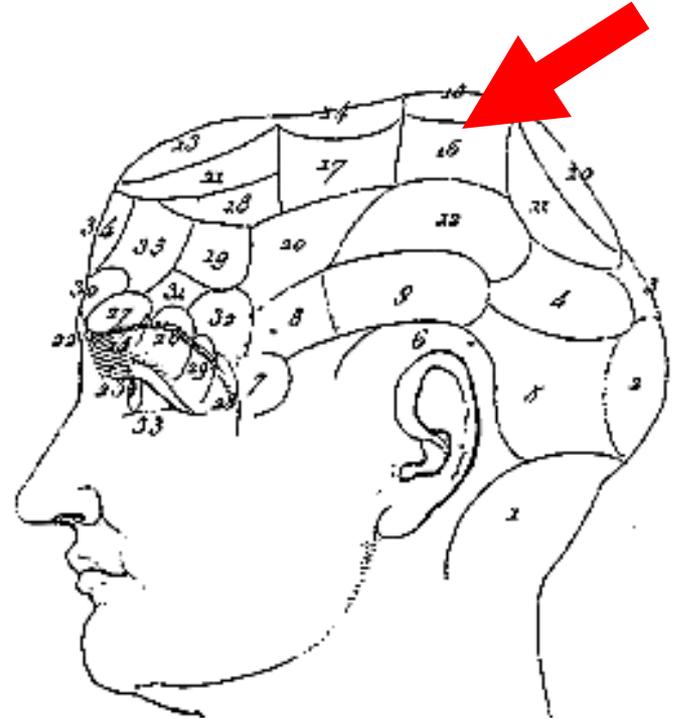

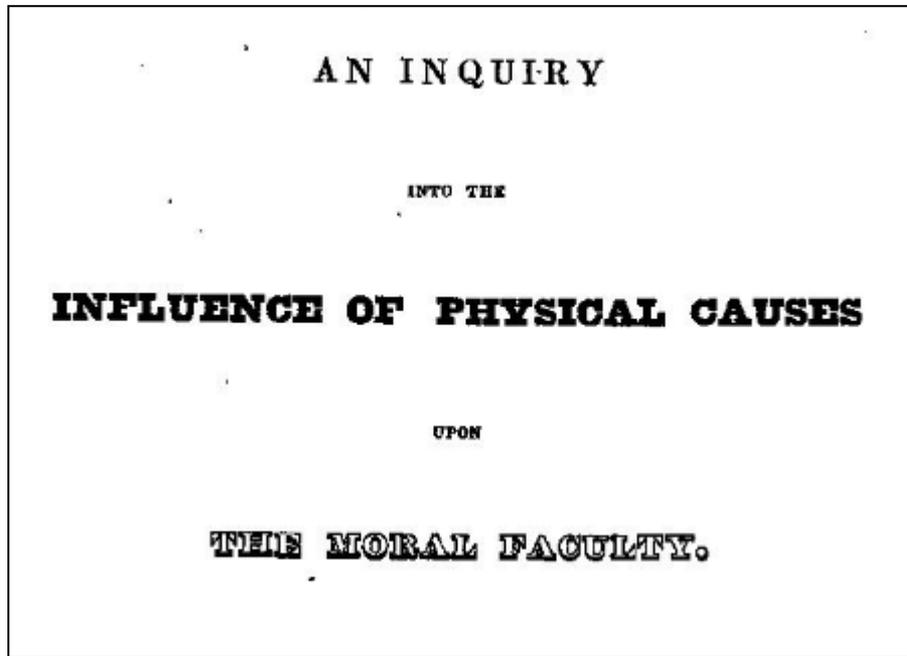

How have we come to think of immoral persons in terms of disordered brains?

Morality in the brain?

Rush, 1786

Spurzheim, 1818 “conscientiousness”

19th century: Immorality as mental disorder

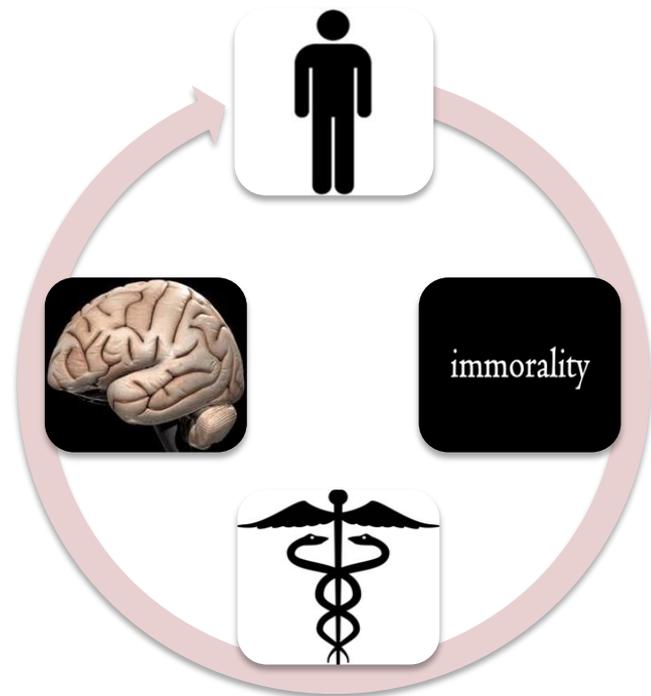

- Moral derangement (Rush, 1812)
- Moral insanity* (Prichard, 1835)
- Moral mania (Ray, 1838)
- Moral imbecility (Krafft-Ebbing, 1890)
- Moral idiocy (Bleuler, 1893)
- ...
- **Render immoral persons as sick**
- **Transfer from sin to mental disorder**
- **“medical model of vice as pathology”** (Rimke & Hunt, 2002)

19th century

- Rise of bio-medical experts
- Medico-legal evaluation
 - Crime → Criminal
 - What have you done? → Who are you?
- Causes obscure
 - Environment
 - Degeneration, Heredity, Brain Disorder

Immoral persons: exemplary cases

- Brain scientific descriptions of immoral persons
- Cerebral seats for morality

Abb. 11. Orbitalhirn- und Augenverletzung (r. Glasauge!). (Gehirnpathologie, Abb. 395.)

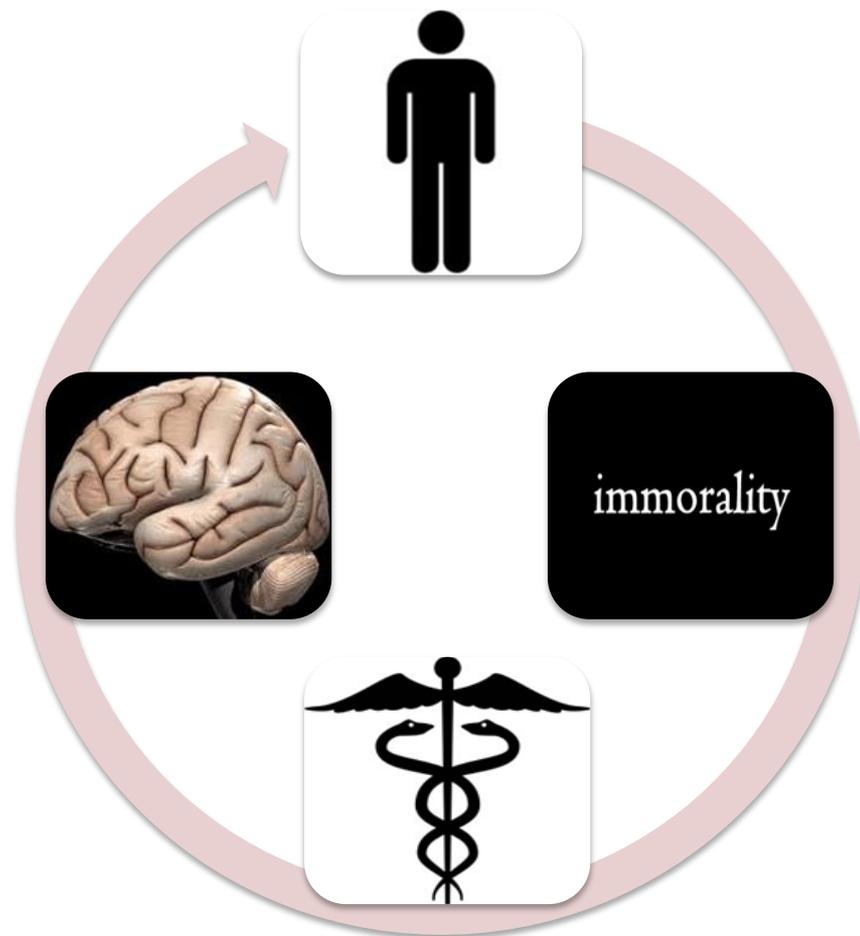

Kleist, 1934 – Gehirnpathologie

Millard Wright

“His counsel [...] requested that his client be permitted to enter a hospital to have a prefrontal lobotomy performed in an attempt to cure the prisoner of his criminal tendencies.” (Mayer 1948)

How have we come to think of immoral persons in terms of disordered brains?

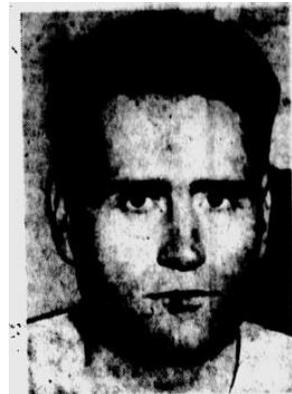

Similar underlying rationale

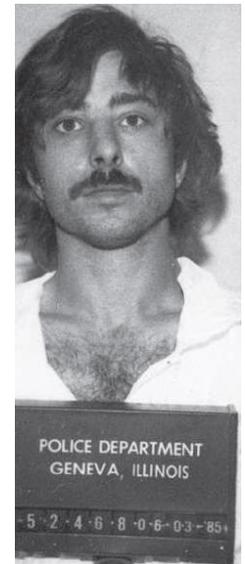

- Naturalization/‘scientification’/‘psychiatrization’
- Brain disorder → immorality
- Bad VS sick (person/culprit VS organism/patient)
- Person exonerated/relieved of responsibility
- Brain blamed/furnished with accountability

Abb. 11. Orbitalhirn- und Augenverletzung
(r. Glasauge!). (Gehirnpathologie,
Abb. 395.)

GENEVA, ILLINOIS

5-2-4-6-8-0-6-0-3-85+

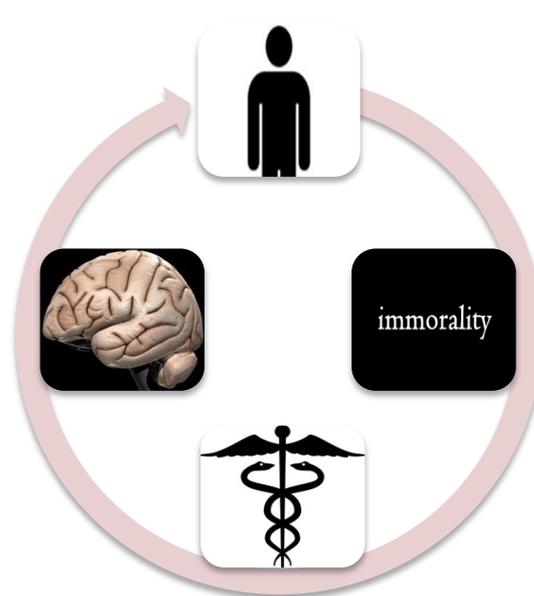

modes of interpretation determine courses of action

- Double-edged sword of bad biology/brains
- prison VS asylum / penal VS health system
- brain as target for intervention and control:
moral bioenhancement

Conclusion

- Brain-based descriptions of immoral persons
 - are of long-standing
 - Change with changing methods & technologies
 - Contested – then and now – yet can have consequences
